Neste and American Airlines collaborate to explore renewable fuel use

Neste and American Airlines have entered into an agreement to explore opportunities to reduce American's environmental footprint through the use of renewable fuels. One goal of the cooperation will be complementary efforts to facilitate acceptance and commercialization of High Freeze Point HEFA (HFP-HEFA) renewable jet fuel which is currently under consideration for approval by ASTM International, a globally recognized leader in the development and delivery of voluntary consensus standards for a range of industries.

Neste's renewable jet fuel technology is proven. Its quality standards, aircraft engine performance, and storage stability and integrity have been tested and followed in thousands of commercial flights.
